 GAMBIA BUREAU OF STATISTICS

Quarterly Gross Domestic Product

Second Quarter, 2023

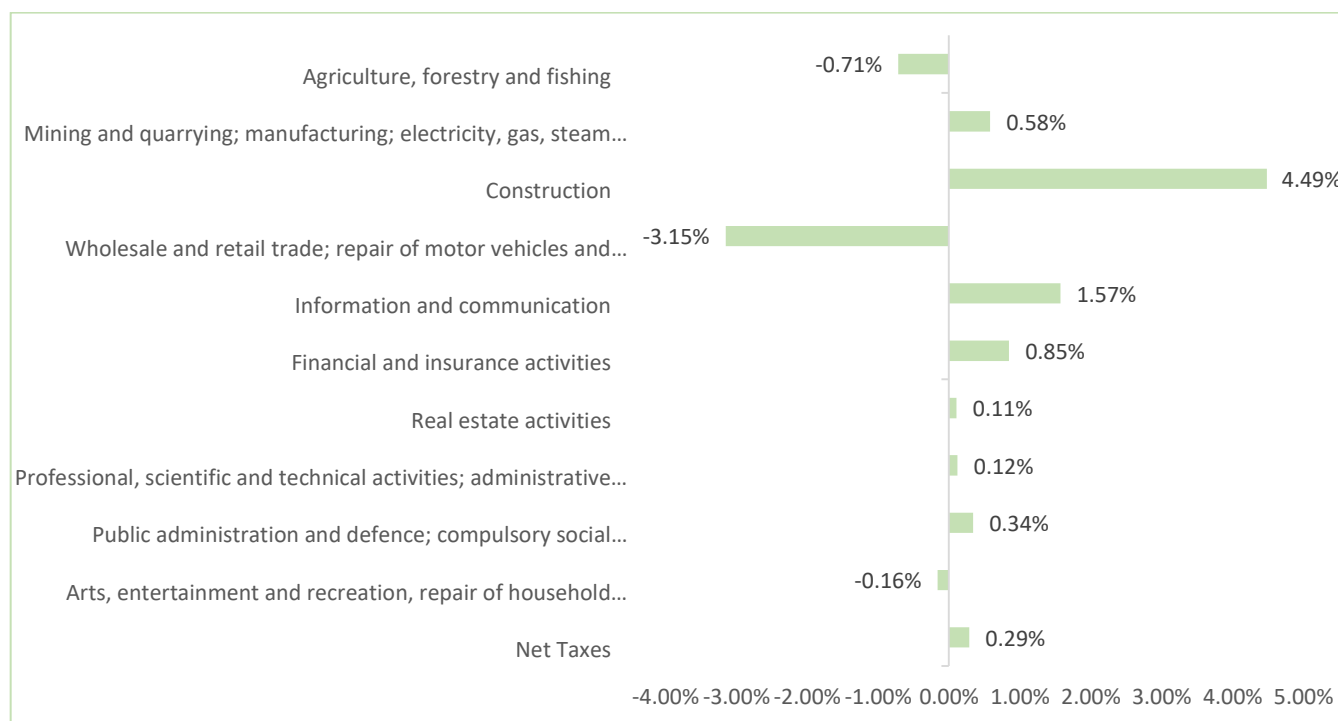

October 2023: Quarterly Gross Domestic Product (QGDP) in the second quarter of 2023 in volume terms has increased by 4.3 % compared with the second quarter of 2022.

The main contribution to this increase is driven by the economic activities such as *Industry, Mining, Electricity and water supply* by +0.58 percentage points, *Construction* by +4.49 percentage points, *Information and communication* by +1.57 percentage points, *Financial services* by +0.85 percentage points, Professional, scientific and administrative support services by +0.12 percentage points and real estate activities by 0.1 percentage point

The industries that led a negative contribution are Agriculture by -0.71 percentage points, Manufacturing by -0.03 and *Wholesale, transport, and accommodation service* by -3.15 percentage points. However, the accommodation services have contributed positively by +0.1 percentage point within the group industry of *wholesale, transport and accommodation service*.

Net taxes on products contributed positively by +0.3 percentage points.

Fig 1 Contribution of the main economic activities to real growth rate of GDP (Q2_2023 / Q2_2022)

Quarterly Gross Domestic Product real growth rates by main economic activities for the second quarter of 2023 compared with the second quarter of 2022 appeared as follows:

Agriculture, Forestry and Fishing activity decreased by 3.5 %. The group of Industry, Mining, Manufacturing, Electricity and Water, increased by 13.3%, where the Electricity and Water supply appeared to increase respectively by 16.6 % and 24.9 %, meanwhile Manufacturing decreased by 1.6 %. Construction activity increased by 27.9 %.

The group of Wholesale and retail trade, Accommodation and Food Service and Transport decreased by 8.8 % although the accommodation sector was increased by 10.4%.

The group of Information and Communication increased by 30.4%. Financial and insurance activities increased by 33.6%. Real estate activity increased by 5.3 %. The group of Professional services and administrative services increased by 19.2 %.

The group of Public administration, Education and Health increased by 6.4 %. However, Education decrease by 16.8% whereas Health and social work activities increased by 31.9%. The group of Arts, entertainment and recreation services, and repair of household’s good and other services decreased by 16.57 %. Net Taxes on products increased by 4.17 %.

FIG 2. CHANGES TO THE SAME QUARTER OF 2022 FOR THE MAIN ECONOMIC ACTIVITIES, (Q2_2023/ Q2_2022) IN %

METHODOLOGY

The compilation of Quarterly GDP estimates at current and constant prices follows the 2017 *IMF Quarterly National Accounts Manual* and the System of National Accounts 2008 (2008 SNA). The QGDP is consistent with the annual GDP as they are based on the same concept and. The main objective of the QGDP is to provide detailed information about the economy to policymakers for planning, policy formulation decision-making and monitoring the economy.

The estimates in this publication are based on data available until June 2023. The main data sources that are used to estimate GDP are in general administrative data. The series are subject to revisions in the future as additional or improved information becomes available.

The publication includes estimates of quarterly GDP by the production approach (QGDP-P) at current and constant prices, non-seasonally series. In addition to QGDP-P, GBoS is further working to develop the quarterly GDP by the expenditures approach as well as to produce the seasonally adjusted series for both approaches.

The indirect method is used mostly for the compilation of QGDP-P. The indirect method implies the estimate of quarterly value added based on the selected quarterly indicators by application of mathematical methods and statistical techniques. This method is based on the assumption that the proportion between the value added, and output is constant within the period of estimation.

The direct method consists of the estimates of output and intermediate consumption separately, and the calculation of value added as a difference. This method is used for some economic activities such as Public Administration, Education, Health, and Financial Activities, for which quarterly data are available for compiling both output and intermediate consumption in a quarterly basis.

The classifications used in the National Accounts is International Standard Industrial Classification of All Economic Activities REV.4 (ISIC Rev.4).

DATA SOURCES

Various statistical and administrative sources are used for the estimation of quarterly GDP by production approach. Data could be statistical products of GBoS or administrative data from different national institutions such as Ministry of Finance and Economic Affairs, Ministry of Agriculture, General Revenues Authority, Central Bank of Gambia, Department of Geology, NAWEC, etc.

The statistical and administrative sources include data gathered from various surveys as Price Statistics Survey, as well as data collected by other institutions for various purposes, such as: Value added tax (VAT); Monetary financial statistics; Balance of Payments; Government fiscal statistics; External trade statistics; Data on electricity and water supply, Data on agriculture and fishing; etc.

SEQUENCE OF COMPILATION

The quarterly GDP are compiled using the following steps:

1. Constructing the quarterly indicators at current and constant prices from different sources for the appropriate recent periods;
2. Development of time series for quarterly data at current and constant prices in order to ensure data comparability and consistency over time;
3. Benchmarking the non-seasonally adjusted series to the relevant annual series;

VOLUME ESTIMATES

The volume measures of quarterly time series are expressed in average prices of the fixed base year (base year 2013) to ensure better consistency with the Annual estimates.

BENCHMARKING

The aim of benchmarking is to ensure the consistency between Quarterly and Annual National Accounts. The consistency between annual and quarterly data is applied to both current and constant price data, where the constant price data are expressed in prices of the base year (2013=100).

The quarterly indicators are benchmarked with the annual data using XLPBM¹ to produce the quarterly gross value added (GVA) estimates. The discrepancies between estimated quarterly data and annual data are minimized during the benchmarking process. The result is the achievement of consistency of quarterly and annual data, that is, the sum of quarterly data is equal to annual data in every year.

PUBLICATION TIMETABLE AND DISSEMINATION POLICY

Regular estimates of quarterly GDP will be published approximately 90 days after the end of the reference quarter. GBoS would like to further shorten the timeliness of QGDP publication in the near future to meet the latest data transmission requirements. Press releases include figures of QGDP, for the main economic activities for the last quarter estimated, information about possible revisions and a brief analysis of the current development of the economy. The press release, the quarterly publication and updated figures are available on the day of publication at the GBoS website <https://www.gbosdata.org/downloads>.

The following quarterly tables of non-seasonally adjusted QGDP series are published for the reference quarter:

- Quarterly Gross Domestic Product, Current Prices;
- Quarterly Gross Domestic Product, Constant Prices, at 2013 base year prices (2013=100);
- Quarterly Gross Domestic Product, Real Growth Rates, comparison with corresponding quarter of previous year.

REVISION POLICIES

The published quarterly GDP estimates in Gambia will be subject to two types of revisions, routine and major revisions.

¹ An Excel function to apply the Denton Proportional Benchmarking Method with Enhancement for Extrapolation. This excel function called XLPBM was developed within the Real Sector Division of the IMF's Statistics Department.

Routine revisions:

These revisions are related with quarterly and annual data changes. Revisions to the previously published series may be made in the last quarter. The frequency and cause of these revisions are as follows:

Quarterly revisions

The first revision of QGDP estimates is in quarterly basis during the last quarter of the year as additional data become available at the end of the year for all the quarters. They will have their impact on the previous quarters as the data reported for the last quarter are accompanied by additional source data or improvements/corrections to the data for previous quarters.

Annual revisions

The second revision is when annual GDP estimates are compiled and/or revised. Quarterly data are benchmarked to the annual GDP estimates, and revisions to annual data will impact the quarterly series. There are two estimates of the annual GDP for a given year "t", provisional and final estimates. Changes that happen during these two annual estimates will directly impact the quarterly GDP series due to benchmarking.

Major revisions:

Major revisions are referred to the rebasing of GDP due to incorporation of new statistical and administrative data sources; improvement of national accounts compilation methods; changes in definitions, methods, and classifications in international level, introduced by new System of National Accounts.

DEFINITIONS

Gross Domestic Product (GDP): Gross Domestic Product at market prices, is the final result of production activity of productive resident units during a year. It is calculated in three approaches: by production, by expenditures and by income approach.

GDP according to production approach is equal to sum of gross added values relevant to different kinds of activities, adding taxes and subtracting subsidies on products (not distributed to sectors or branches of a certain activity);

Output: production of goods and services by an establishment, excluding the value of any goods and services used in an activity for which the establishment does not assume the risk of using the products in production, and excluding the value consumed by the same establishment except for goods and services used for capital formation or own final consumption. There are three types of output such as: market output; output produced for own final use; non-market output.

Intermediate consumption: Intermediate consumption consists of goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital. The goods and services are either transformed or used up by the production services.

Gross Value Added: Gross Value Added represents the contribution of different activities in GDP

and is calculated as the difference between the output and intermediate consumption.

Nominal GDP: measures the current market value of a country's gross domestic product.

Real GDP: measures the volume level of a gross domestic product after changes in prices have been taken into account. It is obtained by expressing values in terms of a base period or previous period prices.

Taxes on products: Taxes on products are paid taxes per unit of some goods and services like the Value Added Tax, excise and customs' tax on imports.

Subsidies on products: Subsidies on products are non-reverse payment made by public administration units to the companies in the form of a certain amount of money per unit of goods or services. Subsidies on imports consist in subsidies of goods or services payable when the product surpasses the border of economic territory or if the services were made to resident institutional units.

Financial intermediation services indirectly measured (FISIM): is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Basic prices: is the price receivable by the producer from the purchaser for a unit of a good or services produced as output, minus any tax payable and plus any subsidy receivable on product. It excludes any transport charges invoiced separately by the producer.

Market prices: is the price after adding taxes and deducting subsidies on products.

Current prices: The prevailing market price paid of goods and services.

Constant prices: Estimation in constant prices represents the estimation in real terms, deflated with prices of a base year or of the previous year.

GDP deflator: The GDP deflator is calculated as GDP at current prices divided by GDP at constant prices.

Base year/Benchmark year: Is the reference year against which data for subsequent periods are measured.

Rebasing: The process of changing the benchmark or reference year from one period to another in measuring production of economic activities of a country.
